- US, UK, Russia, Greece

Neutrino Physics: the simple stuff

Assume a 2×2 neutrino mixing matrix.

$$\begin{pmatrix} \nu_a \\ \nu_b \end{pmatrix} = \begin{pmatrix} \cos(\theta) & \sin(\theta) \\ -\sin(\theta) & \cos(\theta) \end{pmatrix} \begin{pmatrix} \nu_1 \\ \nu_2 \end{pmatrix} \quad (1)$$

$$\begin{aligned} \nu_a(t) &= \cos(\theta)\nu_1(t) + \sin(\theta)\nu_2(t) \\ P(\nu_a \rightarrow \nu_b) &= |<\nu_b|\nu_a(t)>|^2 \\ &= \sin^2(\theta)\cos^2(\theta)|e^{-iE_2t} - e^{-iE_1t}|^2 \end{aligned} \quad (2)$$

Sufficient to understand most of the physics:

$$P(\nu_a \rightarrow \nu_b) = \sin^2 2\theta \sin^2 \frac{1.27(\Delta m^2/eV^2)(L/km)}{(E/GeV)}$$

$$P(\nu_a \rightarrow \nu_a) = 1 - \sin^2 2\theta \sin^2 \frac{1.27(\Delta m^2/eV^2)(L/km)}{(E/GeV)}$$

Oscillation nodes at $\pi/2, 3\pi/2, 5\pi/2, \dots (\pi/2)$:
 $\Delta m^2 = 0.003eV^2, E = 1GeV, L = 412km$.

Neutrino Physics: the difficult stuff

Bill Marciano, hep-ph/0108181

$$\begin{pmatrix} \nu_e \\ \nu_\mu \\ \nu_\tau \end{pmatrix} = \begin{pmatrix} c_1 c_3 & s_1 c_3 & s_3 e^{-i\delta} \\ -s_1 c_2 - c_1 s_2 s_3 e^{i\delta} & c_1 c_2 - s_1 s_2 s_3 e^{i\delta} & s_2 c_3 \\ s_1 s_2 - c_1 c_2 s_3 e^{i\delta} & -c_1 s_2 - s_1 c_2 s_3 e^{i\delta} & c_2 c_3 \end{pmatrix} \begin{pmatrix} \nu_1 \\ \nu_2 \\ \nu_3 \end{pmatrix} \quad (3)$$

$$\begin{aligned}
 P(\nu_\mu \rightarrow \nu_e) &= 4(s_2^2 s_3^2 c_3^2 + J_{CP} \sin \Delta_{21}) \sin^2 \frac{\Delta_{31}}{2} \\
 &\quad + 2(s_1 s_2 s_3 c_1 c_2 c_3^2 \cos \delta - s_1^2 s_2^2 s_3^2 c_3^2) \sin \Delta_{31} \sin \Delta_{21} \\
 &\quad + 4(s_1^2 c_1^2 c_2^2 c_3^2 + s_1^4 s_2^2 s_3^2 c_3^2 - 2s_1^3 s_2 s_3 c_1 c_2 c_3^2 \cos \delta \\
 &\quad - J_{CP} \sin \Delta_{31}) \sin^2 \frac{\Delta_{21}}{2} \\
 &\quad + 8(s_1 s_2 s_3 c_1 c_2 c_3^2 \cos \delta - s_1^2 s_2^2 s_3^2 c_3^2) \sin^2 \frac{\Delta_{31}}{2} \sin^2 \frac{\Delta_{21}}{2}
 \end{aligned} \quad (4)$$

$$\begin{aligned}
\Delta_{31} &\equiv \Delta m_{31}^2 L / 2E_\nu \\
\Delta_{21} &\equiv \Delta m_{21}^2 L / 2E_\nu \\
J_{CP} &\equiv s_1 s_2 s_3 c_1 c_2 c_3^2 \sin \delta
\end{aligned} \tag{5}$$

$$A \equiv \frac{P(\nu_\mu \rightarrow \nu_e) - P(\bar{\nu}_\mu \rightarrow \bar{\nu}_e)}{P(\nu_\mu \rightarrow \nu_e) + P(\bar{\nu}_\mu \rightarrow \bar{\nu}_e)} \tag{6}$$

To leading order in Δ_{21} (assumed to be small), one finds

$$P(\nu_\mu \rightarrow \nu_e) \simeq 4s_2^2 s_3^2 c_3^2 \sin^2 \frac{\Delta_{31}}{2} + \mathcal{O}(\Delta_{21}) \tag{12a}$$

$$A \simeq \frac{J_{CP} \sin \Delta_{21}}{s_2^2 s_3^2 c_3^2} \simeq \frac{2s_1 c_1 c_2 \sin \delta}{s_2 s_3} \left(\frac{\Delta m_{21}^2}{\Delta m_{31}^2} \right) \frac{\Delta m_{31}^2 L}{4E_\nu} + \mathcal{O}(\Delta_{21}^2) \tag{12b}$$

Neutrino Physics: Super K result

Very large signal from asymmetry between upward and downward going muon neutrino rates.

Fit to all global data

C. K. Jung, T. Kajita, T. Mann, and C. McGrew Annu. Rev. Nucl. Part. Sci. 2001 , Vol. 51: 451-488.

Atmospheric Neutrinos $\nu_\mu \rightarrow \nu_\tau$ at 1σ

$$\sin^2 2\theta_{23} > 0.9$$

$$\Delta m_{32}^2 = (2.0 - 4.2) \times 10^{-3} eV^2$$

Best fit: $2.6 \times 10^{-3} eV^2$, $\sin^2 2\theta_{23} = 0.92$.

The most important contributor to the data is

Super-Kamioka collaboration.

Phys.Rev.Lett.81:1562-1567,1998

Next slide has the picture of the data from this PRL.

Neutrino Physics: K2K result

Make neutrino beam with 12 GeV protons from KEK. Approximately 5×10^{19} Protons delivered. KEK-SK distance: 250 km.

44 events (all types) observed out of 64 expected.

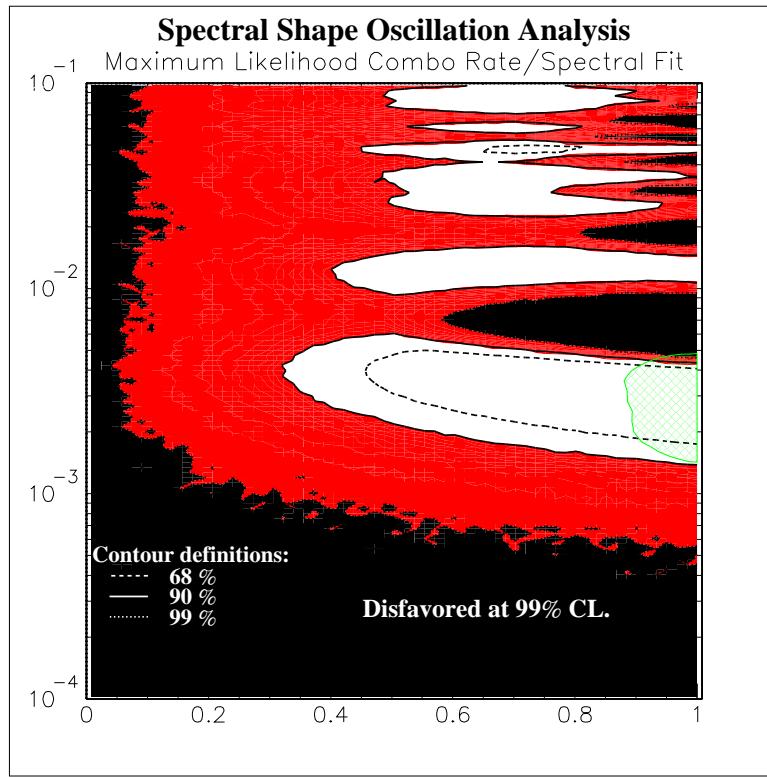

Figure 6.10: Oscillation Allowed Region, Combined Method

The allowed region from the K2K experiment.

From thesis by Eric Sharkey, SUNY at Stony Brook, 2002

Analysis includes fitting spectra.

Neutrino Physics: SNO result

Measure the flux of neutrinos from the SUN.

$$\nu_e + d \rightarrow p + p + e^- (CC)$$

$$\nu + e^- \rightarrow \nu + e^- (ES)$$

$$\nu + d \rightarrow \nu + p + n (NC)$$

Result: Phys.Rev.Lett.89:011301,2002

$$\phi_e = 1.76^{+0.05}_{-0.05} \pm 0.09 \times 10^6 \text{ cm}^{-2} \text{ s}^{-1}$$

$$\phi_{\mu\tau} = 3.41 \pm 0.45 \quad {}^{+0.48}_{-0.45} \times 10^6 \text{ cm}^{-2} \text{ s}^{-1}$$

LMA solution greatly favored.

$$\sin^2 2\theta_{12} = (0.64 - 0.85)$$

$$\Delta m_{21}^2 = (3.2 - 12.6) \times 10^{-5} \text{ eV}^2$$

5

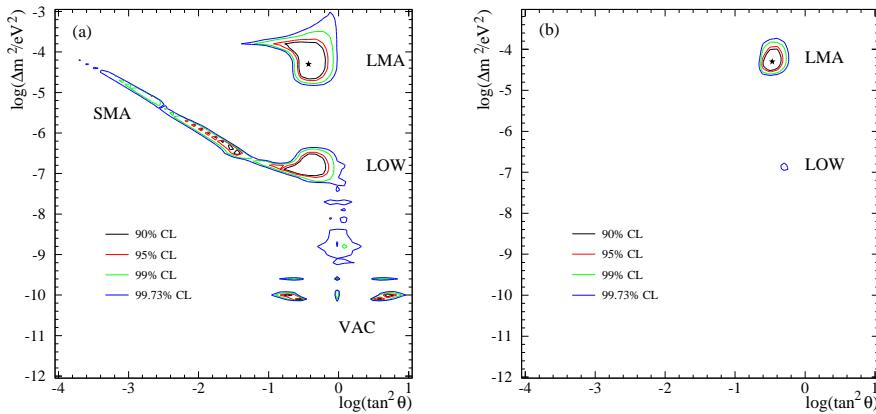

FIG. 4: Allowed regions of the MSW plane determined by a χ^2 fit to (a) SNO day and night energy spectra and (b) with additional experimental and solar model data. The star indicates the best fit. See text for details.

What does it all mean ?

- Atmospheric Neutrinos $\nu_\mu \rightarrow \nu_\tau$ at 1σ

$$\sin^2 2\theta_{23} > 0.9$$

$$\Delta m_{32}^2 = (2.0 - 4.2) \times 10^{-3} eV^2$$

Best fit: $2.6 \times 10^{-3} eV^2$, $\sin^2 2\theta_{23} = 0.92$.

C. K. Jung, T. Kajita, T. Mann, and C. McGrew Annu. Rev.

Nucl. Part. Sci. 2001 , Vol. 51: 451-488.

- Solar Neutrinos $\nu_e \rightarrow (\nu_\mu, \nu_\tau)$ at 1σ New results from SNO. A complete fit to all data by the SNO collaboration ([nucl-ex/0204008](#), [nucl-ex/0204009](#))
LMA solution greatly favored.

$$\sin^2 2\theta_{12} = (0.64 - 0.85)$$

$$\Delta m_{21}^2 = (3.2 - 12.6) \times 10^{-5} eV^2$$

- Null reactor Exps $\bar{\nu}_e \rightarrow \bar{\nu}_e$

$$\sin^2 2\theta_{13} < 0.12$$

- CP violation

Nothing is known.

Some additional information

LSND Sterile neutrinos ?

$$\sin^2 2\theta_{12} \approx \text{few} \times 10^{-3}$$

$$3 \times 10^{-2} < \Delta m_{21}^2 < 3 \text{eV}^2$$

Upward going muons

No evidence for sterile neutrinos in atmospheric Osc.

K2K (56 observed with 80 expected)

disappearance agrees with ν_μ disappearance hypothesis.

- Most important: There is still no conclusive accelerator experiment.

4 GOALS OF NEUTRINO PHYSICS

- Precise determination of Δm_{32}^2 and $\sin^2 2\theta_{23}$ and definitive observation of oscillatory behavior.

MINOS can do this in the near future.

- Detection of $\nu_\mu \rightarrow \nu_e$ in the appearance mode. If $\Delta m_{\nu_\mu \rightarrow \nu_e}^2 = \Delta m_{32}^2$ then $|U_{e3}|^2 (= \sin^2 \theta_{13})$ is non-zero.

MINOS can do this. And could get lucky if the rate is large. We have an opportunity to make this better.

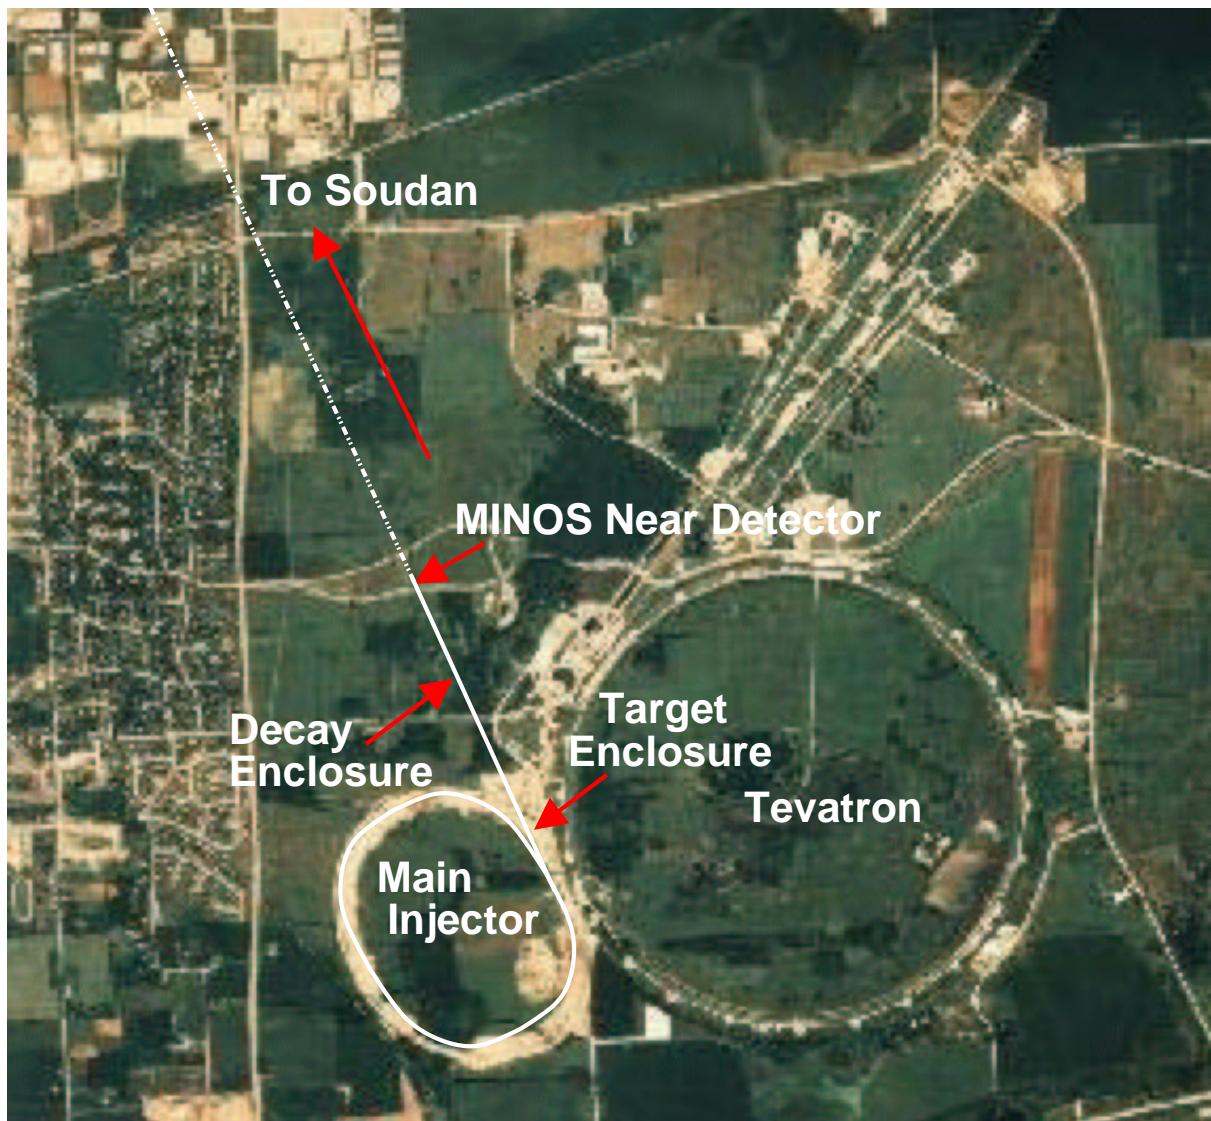

- Detection of the matter enhancement effect in $\nu_\mu \rightarrow \nu_e$. Sign of Δm_{32}^2 ; i.e. which neutrino is heavier.
- Detection of CP violation in neutrino physics. Phase of $|U_{e3}|$ is CP violating and causes asymmetry in the rates $\nu_\mu \rightarrow \nu_e$ versus $\bar{\nu}_\mu \rightarrow \bar{\nu}_e$.

MINOS Overview

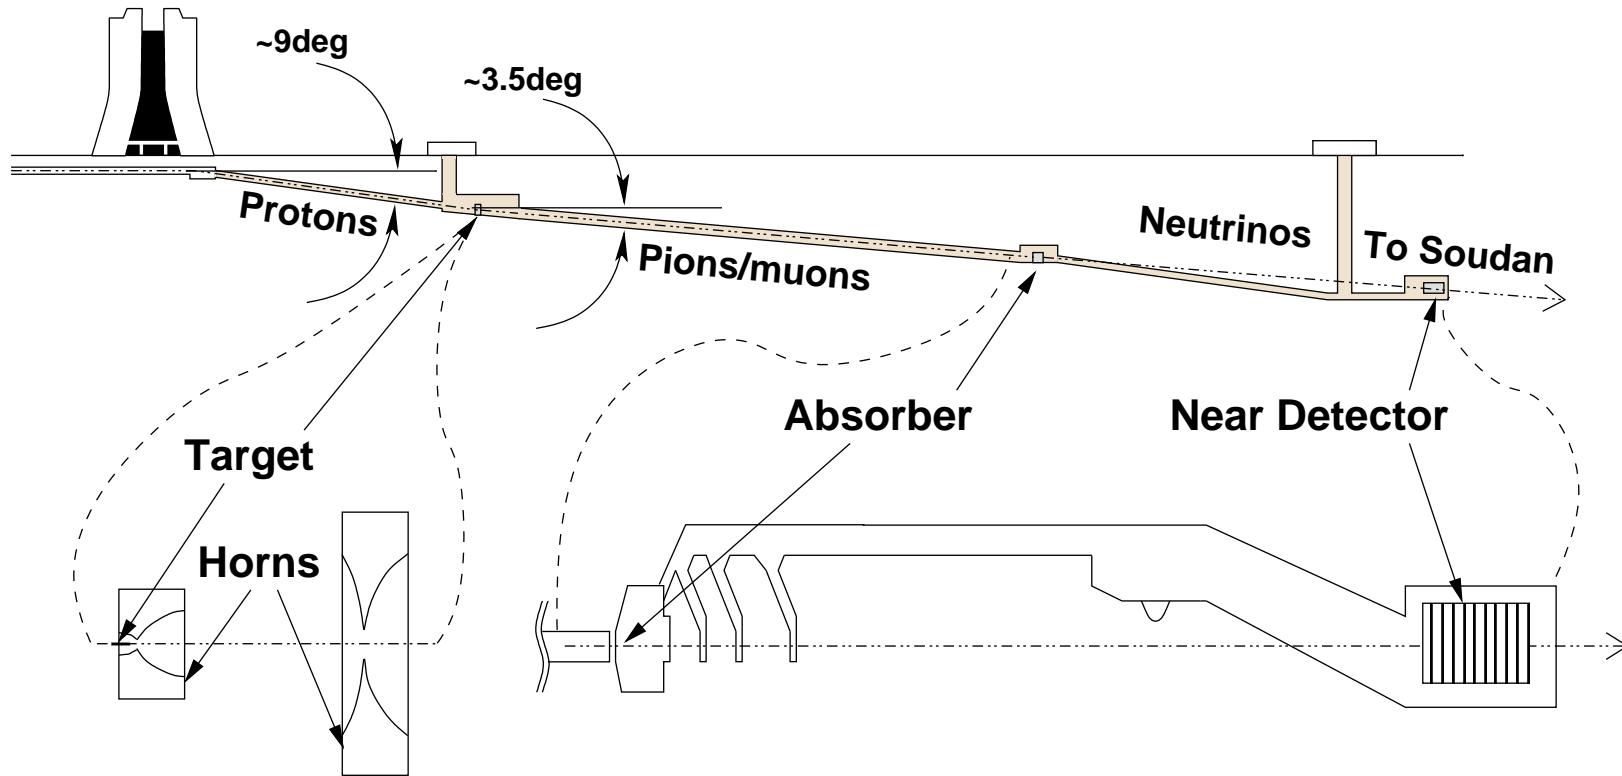

MINOS = Main Injector Neutrino Oscillation Search

- 120 GeV MI protons on graphite target
 - 5/6 batches (\bar{p} /no \bar{p})
 - 84 3-8 ns bunches/batch
 - 8.1 or 9.8 μ sec spill every 1.9 sec
 - 4×10^{13} protons/spill (max)
 - 3.8×10^{20} protons/year
- 2 horn pion focusing
- “LE” 1-6 GeV neutrinos w/ tail out to 50 GeV
- 735.340 km baseline.
- Near and Far iron/scintillator detectors
 - Near @ FNAL: 3 events/spill in “target region”
 - Far @ Soudan, MINN: 3000 ν_μ CC events/kt/yr (no osc.)

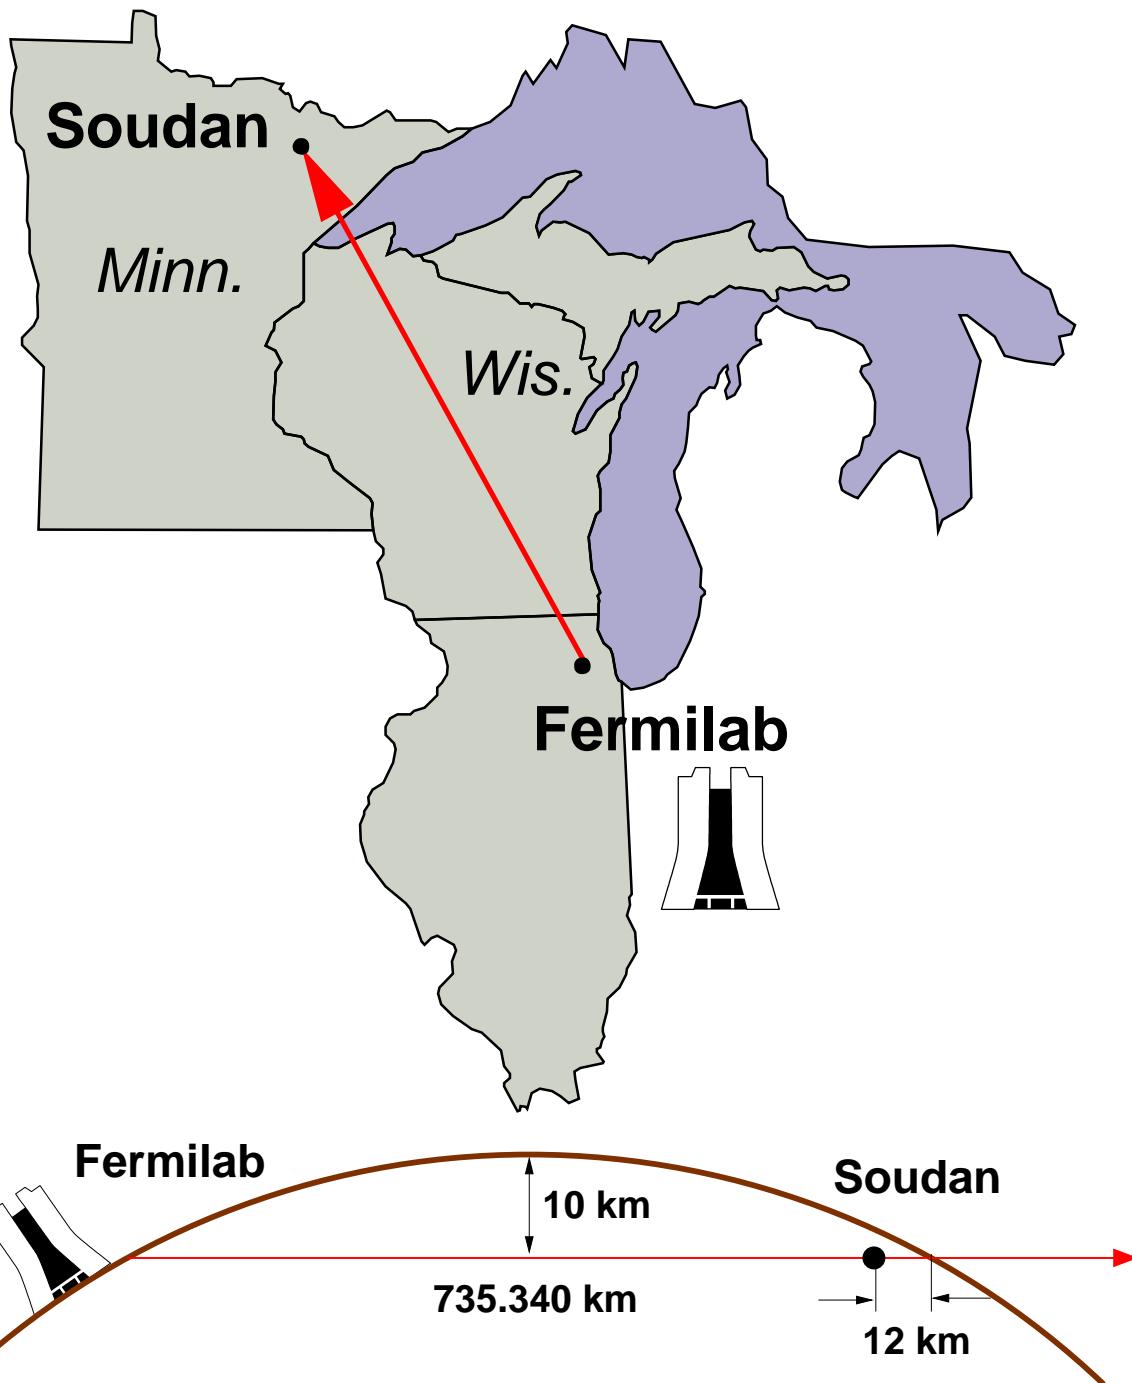

Aerial View

Neutrino Production

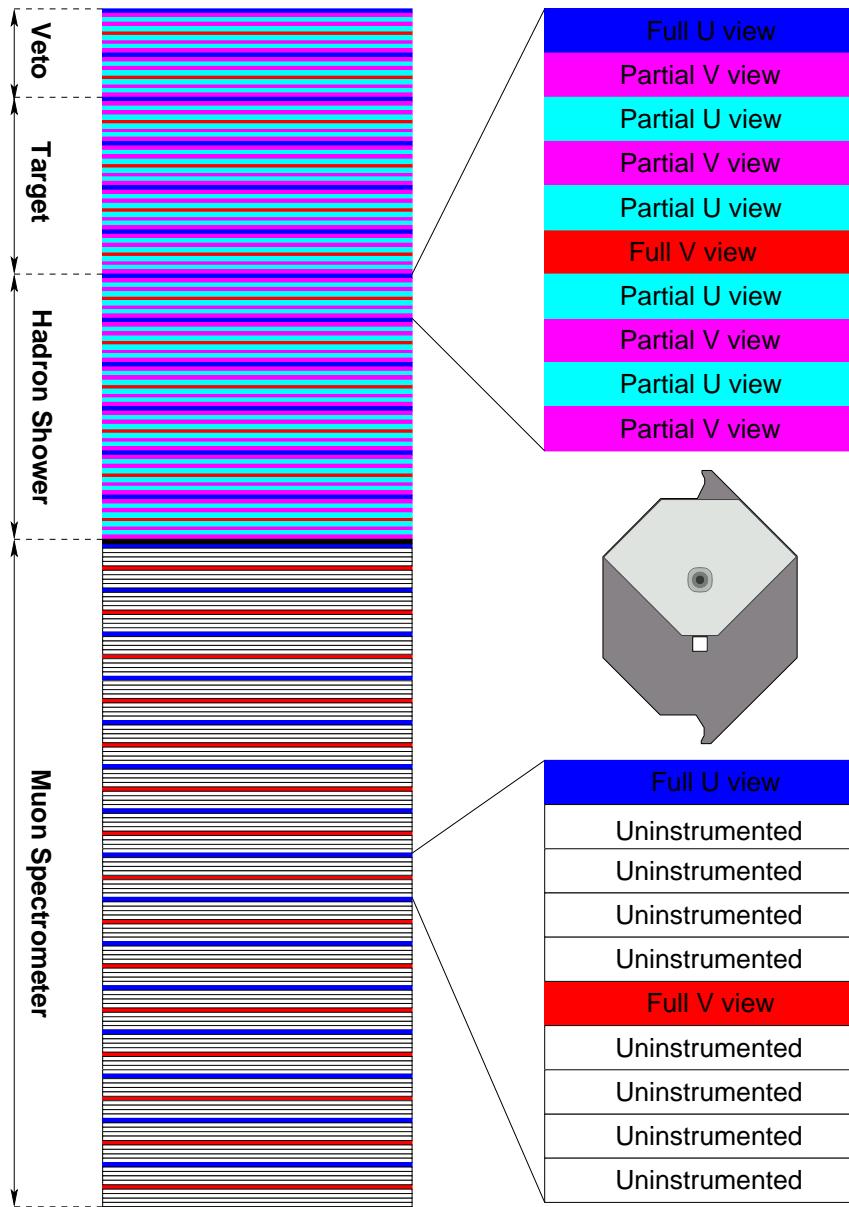

Base Line

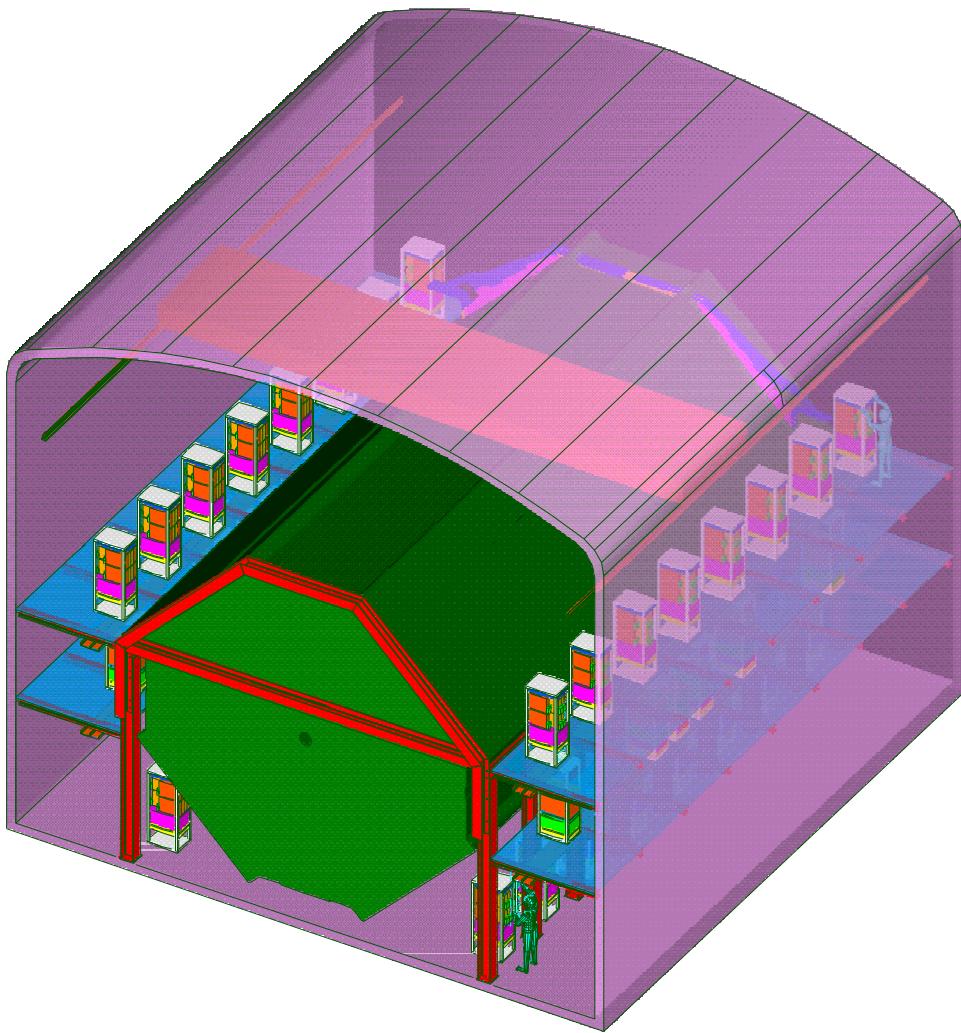

Near Detector

- 1 kt (0.1 kt fiducial).
- 282 steel planes
- 153 scintillator planes
- 68 or 96 scintillator strips/plane.
- 1 ended readout, no multiplexing

Far Detector

- 5.4kt (3.3kt fiducial)
- 486 steel planes (243/243)
- 484 scintillator planes (242/242)
- 192 scintillator strips/plane.
- 2 ended readout, 8x multiplexing

Current Status and Schedule

- Calibration Detector taking data at CERN.
- NuMI turn on: First protons Dec 2004, Fully commissioned Feb 9, 2005.
- Near Detector tunnel finished. Beampipe being installed.
- Far Detector hall finished
- 53 weeks of installation finished
- 2.9 kT finished.
- Magnet coil installed and turned on in Super Module 1.
Finish both Super-Modules: Oct 2003.
- First upward going muon detected.

Some pictures

- Numi Tunnel finished
- Installation of decay pipe started
- Far detector hall in June 2001.
- Far Detector hall finished with first plane
- 53 weeks of installation finished
- Magnet coil installed and turned on in Super Module 1.
- First Bending muon.

Expected Limits

(ν_e appearance)

Expected Sensitivities (ν_e appearance)

Green test point at $\theta_{13} = .14$, $\theta_{12} = \pi/4$,
 $\theta_{23} = \pi/4$, $\delta m_{12}^2 = 0.0001\text{eV}^2$, $\delta m_{23}^2 = 0.003\text{eV}^2$,
 $\phi = 2\pi/3$.

Black line is $1-\sigma$, 10 kt-yr $\nu_\mu \rightarrow \nu_e$

Red line is $1-\sigma$, 20 kt-yr $\bar{\nu}_\mu \rightarrow \bar{\nu}_e$

Future Experimental Approach

- More flux at lower energy
 - Improve Δm^2 resolution. Observe a dip in the spectrum.
 - New target/horn design
 - Event rate
 - Muon detection threshold in detector ?
- Enhance sensitivity to ν_e
 - Reduce high energy flux (NC back.)
 - Make detector better ?
 - Build another detector ?
- Build a separate detector Off-axis.
- Build a new beam to send to very long distances. Focus of our working group.

Why go off-axis for neutrino beam ?

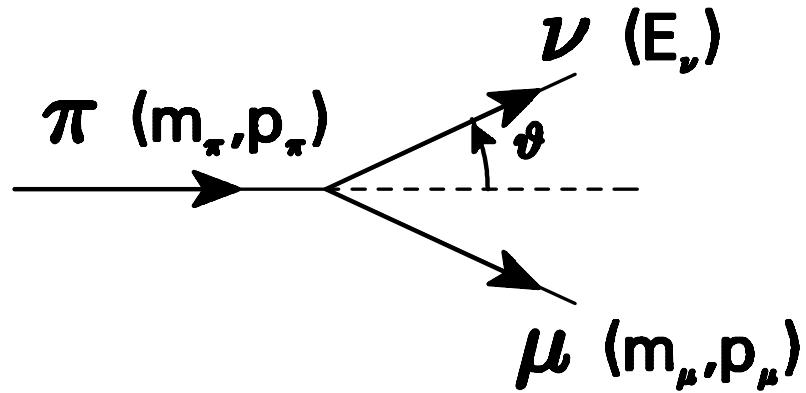

- Natural way to get a narrow band beam.
- Beam energy is almost independent of pion energy.
- Pions of a broad energy spectrum contribute to the same neutrino energy bin.
- No sacrifice of flux to get a narrow band beam.

Originally proposed by E889 Collaboration

Long Baseline Neutrino Oscillation Experiment,
D. Beavis et al., Physics Design Report, BNL
52459. April 1995.

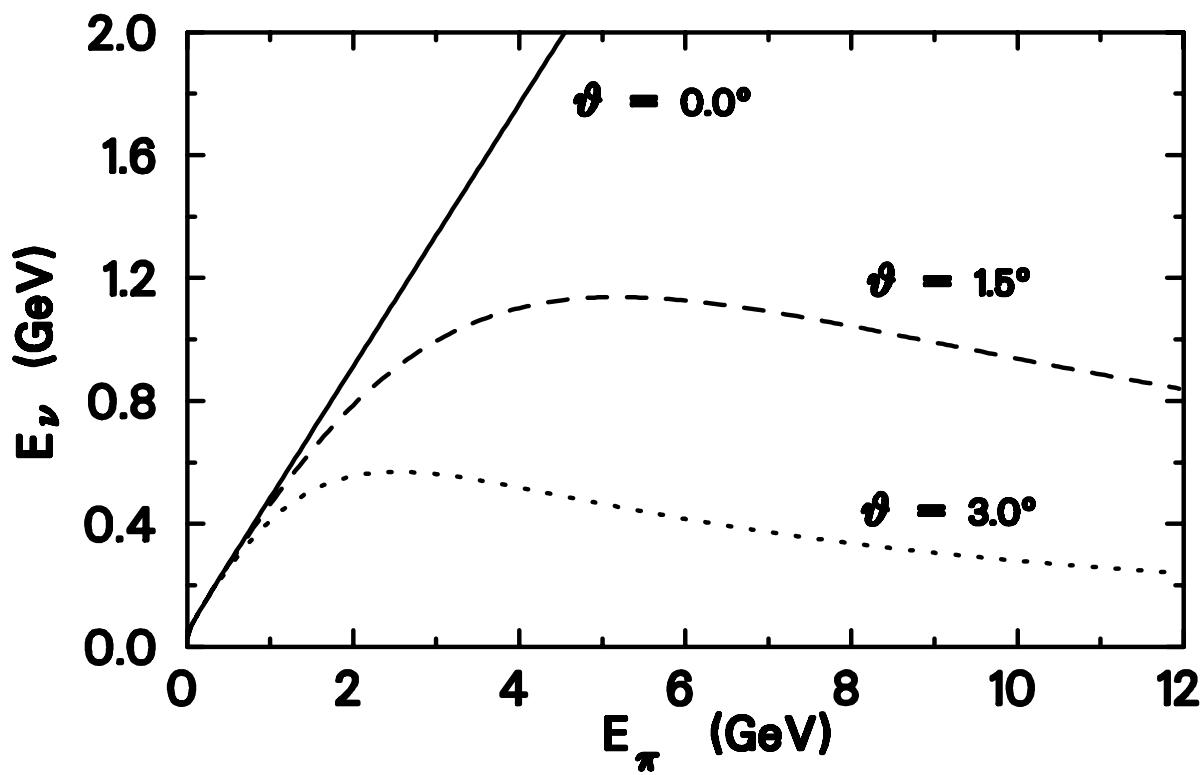

Now being considered for the JHF-SK proposal.

And new initiatives for the NUMI beam.

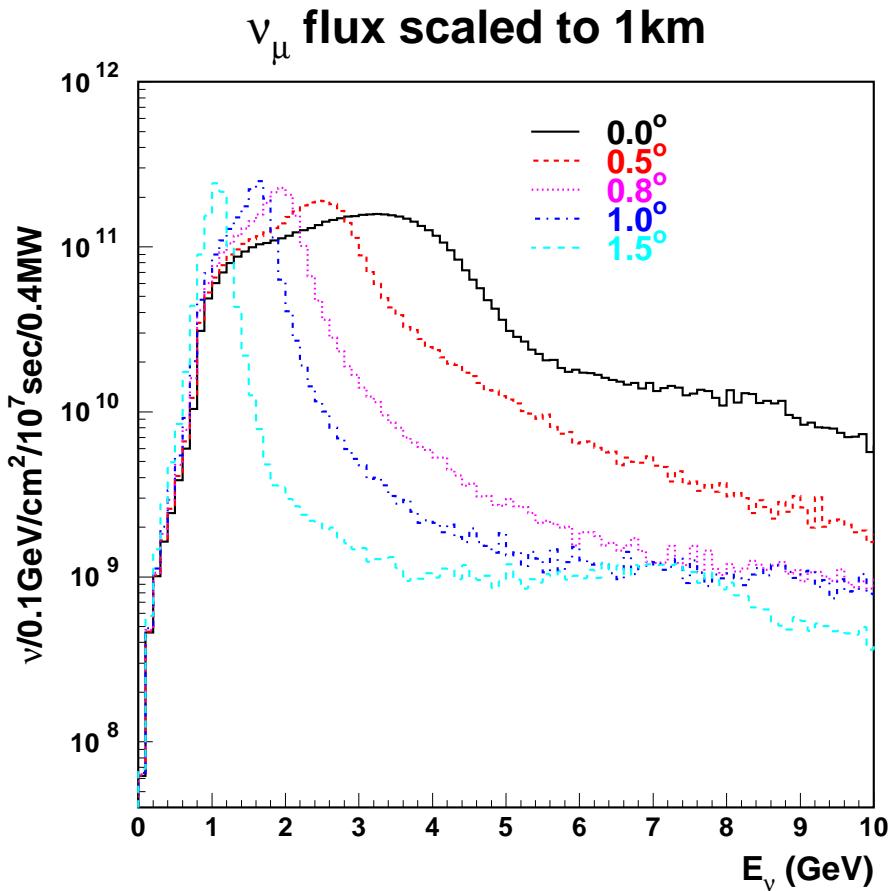

From energy, momentum conservation

$$E_\nu = \frac{m_\pi^2 - m_\mu^2}{2(E_\pi - p_\pi \cos\theta)}$$

FNAL LE beam

@ $\Delta m_{atm}^2 = 2.5 \times 10^{-3}$

Angle (deg)	E_{peak} (GeV)	L_{osc} (km)	
0.0	3.0	1500	
0.5	2.5	1250	
0.8	2.0	1000	(L. Lake)
1.0	1.5	750	(Soudan)
1.5	1.0	500	(Keenan)
2.0	0.7	350	

Conclusions

- MINOS will measure Δm_{32}^2 with $\sim 10\%$ error.
- New initiatives for NUMI beam sought.
Original idea from BNL-E889 of using an off-axis beam to make a narrow band beam being revived.
Considerable interest in redesigning the beam to make it lower energy.
- Neutrino oscillations and mixing has the same “dignity” as quark mixing and must be understood with the same scale of effort.
